NOTE: These ballast configurations are only approximate. They are based on rated engine power, GOODYEAR DUAL tire sizes shown, and 3/4 tank of fuel. Tractor weight, and weight splits are highly dependant on the many versions, options, and tires available. The configurations are calculated without a power take off. Only 60/40 configurations are calculated with a three point hitch. Ballast adjustments will be required with different tires, hitch and PTO configurations. **Note: The rear frame weight bracket that supports suitcase weights is not compatible with a three point hitch. See your operators manual and the New Holland Tractor Ballasting Guide for further ballasting details.**

Use the Weighting and Ballasting CD or Ballasting Guide to properly ballast your tractor.

You can ballast the **New Holland T9.000 Series to 80 lb/hp, 90lb/hp, 100 lb/hp, 105 lb/hp, 110 lb/hp and 120 lb/hp** using the weight components available as Field Installed Attachments. Suitcase weights are 100 lbs each. The components required for these ballast levels are listed in the shaded areas of this table for your reference.

SPECIAL NOTES REGARDING SHIPPING OF BALLAST PACKAGES:

Most trucks cannot haul more than a 42,000 lb payload without exceeding 80,000 lbs. Gross Vehicle Weight (G.V.W.). D.O.T. regulations do not allow loose items (the duals, or other items not attached to the tractor) to be shipped on loads exceeding 80,000 G.V.W.

Many New Holland T9 tractors ordered with the larger, heavier tire sizes and ballast packages exceed 80,000 lb. G.V.W. The factory installed ballast order restrictions are listed on the price pages .

Many ballast configurations cause the payload to exceed 42,000 lbs. Any loose items that can be removed from the payload to meet weight restrictions have to be removed and shipped separately. Therefore, if a mounted ballast package causes an order to exceed the weight limitation, then the duals will be shipped on a separate truck.

Factory Installed Ballast Packages

All ballast packages that can be mounted at the factory and shipped by truckload (meeting weight limitations) are displayed under “Factory Installed ballast packages” in the ballast section for each model.

Factory Installed Ballast Packages with the Excess Weight option 429303. REQUIRES 429303 to be ordered

Ballast packages displayed under the above title in the price pages will be overweight. Duals will ship on a seperate truck regardless if the tractor is shipped by New Holland or if your dealership picks up the tractor. New Holland is not responsible for any costs incurred to meet shipping requirements when these ballast packages are factory mounted and your dealership Will Calls the tractor.

If your dealership wants the duals shipped on the same truck as the tractor and the ballast package you require makes the tractor overweight, you will have to **place a separate order for the ballast needed under field installed attachments**.

Special Feature Requests (SFR)

The Special Feature Request (SFR) process provides New Holland dealers with a method of offering features to their customers that are not addressed by the base unit and option configurations in the price book. Special features are developed as unique solutions to individual requirements.

SFR codes are not listed in the P&D pages. They are, however, factory approved custom solutions to fill the specialized needs of New Holland 4WD customers.

T9 Series tractors offer features unparalleled in the industry. In addition there are a number of P&D options that allow you to configure the tractor to suit a myriad of applications. Despite this extensive offering, there may be times when your customers have applications that are not addressed by the options in the P&D pages. The SFR process is in place to allow you to offer your customers an individualized solution to address their special applications.

The Special Feature Request Process

A SFR is normally initiated by New Holland Dealers.

Once the SFR request sheet is completed it is faxed to the NH Marketing Department who approves and forwards it to the plant. The plant then begins a sequential process of developing a bid price. The following sequence of events takes place at Fargo when SFR bids are developed:

1. A Bid/No Bid determination is made
2. If the decision is made to bid the request, a cost sheet is generated, if the decision is made to not bid the SFR the originator of the request sheet is notified
3. The costs to complete the SFR are determined and a final bid is developed
4. The final bid is reviewed for completeness and accuracy
5. The bid is approved, revised, or declined by Fargo Plant Management and the Pricing Group
6. If approved, the bid is given to the originator of the SFR request
7. The originator prices the bid to the customer

How Long Does a SFR Bid Take?

If the determination is made to bid the SFR, the completed bid price will be quoted within one week (five business days) via e-mail to the person originating the request, with a copy to the NH Marketing Department.

Ordering Deadlines

You should note that quoted prices are valid for one month beginning on the quote date. If an order is not submitted within the 30 day period the bid is considered void.

Some Notes About Costs

The cost of developing a single special feature can sometimes be quite expensive. This high cost is due to one time engineering and manufacturing costs that are recovered in the price of the SFR. Orders for multiple units with the same SFR feature decrease the cost per unit by spreading this fixed cost (development and engineering) over the multiple units. In addition, all SFRs are kept on file. If a request matches a project completed earlier the development time and cost of the SFR is reduced and the cost savings is reflected in the quote to the originator.

Special Feature Requests (SFR)

Examples of SFRs

An example of a Special Features Request completed for 4WD customers are:

- Tire sizes and brands not offered in the P&D pages

The Special Feature Request process allows you, the New Holland dealer, to better serve your customers. By developing features to address customer's individual needs you are assisting him/her in becoming more productive and profitable. Use the SFR process to assist you in selling the T9 Series tractors.

SFR Description/ Market Analysis:

Briefly describe the Special Feature Request that you are applying for:

What market need or niche does this feature satisfy that is not available today?:

How many units will you retail with this Special Feature Request over the next 30 days, and within the next year? Are these retails at risk if the SFR is denied and is the offering available on a competitive unit?:

Does this SFR address a current gap in the parts product offering - i.e. a complete cab or transmission not available through parts?:

Are their other alternatives to the SFR you are requesting - i.e. can the market need you've identified above be satisfied through other means?:

Ship by Rail Process -- Fargo 4WD Tractors

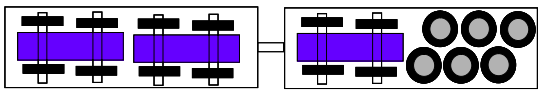
High trucking costs can be a substantial expense to your agricultural dealership. In some cases, shipping by rail can offer a cost effective alternative. The intent of this summary is to establish a set of guidelines for you to obtain a quote, and to understand the process involved with shipping 4WD tractors from the Fargo ND plant by rail.

The Fargo tractor plant is served by the BNSF Railway. BNSF's shipping area covers the US west of the Mississippi. As the originating railroad, BNSF can quote and arrange any tractor shipments from Fargo, even if it is outside their area of coverage where interconnections must be made with other railroads for the final destination. Rail shipment economies depend on geographic location, interconnecting railroads, the number of units being shipped, costs of shipping units from the final rail destination to the dealership, and rail transit times. When comparing rail costs to truck costs, keep in mind that a 4WD tractor with duals and ballast may have to ship on two trucks or require an overweight permit. Weight is not an issue for shipping by rail.

The following is the process for shipping Fargo 4WD tractors by rail:

1. Understand what will fit on train cars

Fargo tractors
- 1 wheeled unit with duals will fit on one 60 ft. car.
- 3 wheeled units and duals will fit on two 60 ft. cars.
- Dual tires are in stacks of two.
- 250,000 lbs. per car weight limit



2. Contact Sales Manager at Burlington Northern Santa Fe (BNSF)

- LaToya Benson, Industrial Products Sales, is the point of contact for dealers to arrange rail shipments from Fargo or Racine.

  Office (708) 924-6758
  Mobile (312) 316-6827
  Email LaToya.Benson@bnsf.com

- To request a shipping quote, send an email to LaToya Benson above, include the following information:
  - Dealership name, city and state.
  - Potential volume of units to be shipped by rail.
  - Is the store location rail served or not rail served?
    - If the store is not rail served, then BNSF can help locate the nearest **Team Track Ramp** or **Transloader**. See below for definitions:
    - **Team Track Ramp:** This is a rail drop off point equipped with a ramp for unloading tractors. When the train arrives a notice is sent to the receiving dealership that is responsible for unloading the tractor and any duals within a 48 hour period.
    - **Transloader:** This is full service drop off point. The Transloader is a 3rd party who can be hired to unload and store the equipment. Some Transloaders have trucking services such that they can deliver equipment to a final destination. The Transloader is independent of BNSF and CNH.
    - If your dealership is located in the US west of the Mississippi, refer to the BNSF map online showing **Team Track Ramps** and **Trans Loaders at http://domino.bnsf.com/website/bnsfpmtn.nsf/welcome.** If you are located east of the Mississippi or in Canada, contact BNSF to identify unloading locations.

Ship by Rail Process -- Fargo 4WD Tractors

- BNSF will establish a through rate, per car, from the plant to the final rail destination, a shipping pattern, and an estimated transit time. The shipping pattern contains specific instructions for the rail Bill of Lading. The rates are established using the CNH discount. Contract rates are good through the end of the calendar year (December 31st).
- BNSF will assist you to complete an application and establish an account for the dealership.

3. Place orders for tractors and notify Fargo shipping yard

- Orders must be marked to ship R (Rail Road).
- Fargo orders must have code 314 if required for mounted ballast.
- In the comments section of the order include: BNSF contract number, shipping pattern, and all the order numbers to ship by rail.
- ATS Supply Chain Solutions is the releasing yard for the plant. Send ATS a notification of the order numbers that will ship by rail.

  Phone 701-235-2101
  Fax 701-235-2161

4. The tractors are built and released to the releasing yard.

- The releasing yard will load the tractor(s) and any duals. The order will invoice and the terms will start. BNSF will pick up the rail car(s) at the next scheduled switch.

5. BNSF will bill the dealer directly.

- An invoice will be generated as soon as the load is billed out at the plant. The standard billing terms are 15 days. The bill will include the per car rate, and a fuel surcharge. During transport, BNSF Liability is limited to $25,000 (U.S. dollars) per car, and additional coverage is available through BNSF.
- Online tracking, fuel surcharge, and other tools are available at **http://www.bnsf.com**

6. Arrive final rail destination

- If the final destination is a **Team Track Ramp**, then on arrival the dealer will be notified and has a 48 hour window to unload the unit. There is a $75 (U.S. dollars) per day demurrage charge, for everyday beyond the 48 hour unloading window.
- If the final destination is a **Trans Loader,** then the unit will be unloaded and stored or per the agreement between the dealer and the Trans Loader facility.
- It is the dealer's responsibility to move the equipment from the rail destination to the dealership.

You now have a process to obtain a quote for shipping Fargo tractors via rail. You be the judge if shipping by rail is right for your business.

NEW HOLLAND SMARTTRAX™ T9.615 AND T9.670 ORDERING GUIDE

EXCLUSIVE NEW HOLLAND SMARTTRAX™ FEATURES

- **Available in two configurations –** Industry-leading premium high idler configuration and standard triangular layout.
- **Low maintenance –** Check oil once a year and service after 5000 hours.
- **Guaranteed reliability –** 2 year-warranty.

BENEFITS OF A LARGE TRACK FOOTPRINT

- **Increased flotation and reduced soil compaction** which leads to increased soil fertility and improved water drainage while decreasing soil runoff and erosion.
- **Less surface damage** due to reduced ground pressure. Ground surface debris is pulled under the track, keeping the track module and the tractor on top which further improves flotation and minimizes surface damage.
- **Increased traction and reduced slippage** for optimum pulling efficiency.
- **A smooth ride** resulting from long tracks that bridge rough terrain.

EXCLUSIVE NEW HOLLAND SMARTTRAX™ BENEFITS

- **Climbing ability –** The high idler configuration allows the track module to climb over large obstacles.
- **Reliability –** Toughest belts in the industry provide uniform load to the ground and longest belt life.
- **Convertibility –** Simple installation allows you to convert from wheels to tracks in less than a day.
- **Versatility –** You have the flexibility to use SmartTrax track modules on your tractor for spring planting and then install on your combine for fall harvest, or convert the tractor back to wheels for resale and install the tracks on your next machine.
- **Efficiency –** The positive drive system eliminates belt-to-drive-wheel slippage while operating at low belt tension, increasing overall drive system efficiency. Belt tension is maintained with tensioning cylinder and dual accumulators for efficient belt operation and maximum life.
- **Cost of ownership –** The total cost of ownership is lower than any other track system on the market. The modular system gives you flexibility to apply to other units. Investment in one set of modules will roll through several machine cycles.

DISADVANTAGES OF A TWIN TRACK TRACTOR

Twin tracks do a great job of distributing the weight when not loaded, but when loaded the rear wheel pressure escalates considerably.

Additional disadvantages are:

- Turning at the end of row requires stab turning to reduce berming. It is suggested to allow the drawbar to swing to allow the implement to track inside the vehicle radius.

- **Ballasting Concerns**
  Additional ballasting weight may be necessary to optimize power to ground without slippage.

- **Steering Concerns**
  Steering a twin track tractor also adds some additional challenges.

Reed Turner writes the following regarding the differences between steering a rubber belt tractor and a tire tractor:

Rubber tire tractors generally steer better than the rubber belt tractors. When a rubber tire tractor is steered, the tires turn an point in the direction of the turn. When a rubber belt tractor is steered, the track on the outside of the turn speeds up and the track on the inside of the turn slows down. Under moderate to heavy draft loads, a rubber tire tractor may slide sideways as it turns, but it still turns. Under similar draft loads, a rubber belt tractor may not turn at all.This is a nuisance and can present a serious problem if an operator doesn't expect it. With rubber belttracks the draft load must be reduced before significant steering can occur. As a rubber belt tractor turns, the tracks slip sideways, pushing soil and producing ridges and depressions. A tire rolls through a turn and produces little soil disturbance. Steering a rubber belt system requires more power than steering a rubber tire. The extra power is needed to overcome the sideways slipping and to speed up the outside track.This can cause overload or stalling problems when the tractor is steered while operating near full engine load. What differentiates the T9 Series equipped with SMARTTRAX™ is the tracks turn and point in the direction the vehicle is steered. This helps to reduce the berming while turning and reduces the sideways forces placed on the tracks and their driveline components.

MODEL 710 DEW SIMULATOR

Description: A high-pressure sprayer designed to specifically place moisture into windrowed alfalfa in a uniform manner very similar to the re-wetting of hay by natural dew. Ten minutes after treating, dry alfalfa is softened up and can be baled with the leaves attached and the hay in excellent condition. Sixty-five tines are attached to a reel that is controlled by cams that orient the tines so that they enter and exit the windrowed alfalfa without disturbing it. Spray delivery to the tines is controlled so that they spray only when inside the windrow. A high-pressure, high-delivery pump is PTO driven to attach a working pressure of 2,500 PSI.

Specifications:

1. 65 plated tines on cammed reel
2. 10 high-pressure valves control the tines rows with adjustable actuator so that they spray only in the windrow
3. PTO driven high-pressure pump delivery 14 gpm at 2500 PSI @ 900 rpm
4. Reel lowers to the right of mainframe
5. In field float system
6. 1500-gallon tank towing capacity (tank not included)

Capacities:

1. 800 gallons per hour pumping rate will treat between 30 and 50 tons per hour, depending on initial hay moisture and climatic conditions
2. PTO output requirements: high-speed shaft at 900 rpm draw 30 horsepower
3. Additional horsepower required to pull weight of reservoir (not supplied)
4. Unit weight: 4,280 pounds
5. All tires, cylinders and hoses supplied
